Clamp set for Spiderbeam 12m HD fiberglass pole

For portable installations, most people simply use sticky tape for locking the individual tube segments, and this works very well. However, the following rubber padded clamps are the perfect method to securely lock the segments of the fiberglass mast for a long period. They are especially suitable for permanent installations and superior to all other locking mechanisms (tape, glue, cable ites,...). They have a very strong grip, yet can be removed easily even after years of installation. The rubber padding protects the mast against any damage. Due to the rubber providing good grip, only little force is needed when tightening the clamps.

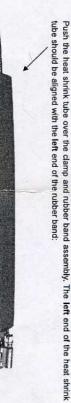

Fabricating the rubber padded Clamps

Start with cutting a piece of rubber band (15x3mm) and a piece of heat shrink tube (13mm diameter), suitable for each clamp:

Total:	12	##	10	9	œ	7	6	5	4	3	2	fiberglass tube segment
11 clamps	10 – 16 mm	12 – 20 mm	16 – 27 mm	20 – 32 mm	23 – 35 mm	25 – 40 mm	30 – 45 mm	30 – 45 mm	32 – 50 mm	40 – 60 mm	40 - 60 mm	stainless steel clamp
1165 mm	35 mm	50 mm	65 mm	80 mm	90 mm	105 mm	115 mm	125 mm	140 mm	155 mm	170 mm	length of rubber band
880 mm	30 mm	35 mm	45 mm	50 mm	60 mm	75 mm	85 mm	95 mm	110 mm	125 mm	140 mm	length of heat shrink tube

Now open each clamp, flatten it somewhat, and place it onto the rubber band. The right end of the rubber band should be aligned with the right end of the clamp:

After heating & shrinking, the fully assembled clamp will look as pictured below:

As shown in the photo, the right end of the heat shrink tube should have a distance of approx. 15mm from the screw casing.

Now close the clamp and it is ready to use.

In case the heat shrink tube shows wrinkles when closing the clamp, simply apply some more heat and the wrinkles will go away easily.

Installing the Clamps on the Mast

The first clamp (40-60mm diameter) is mounted at the bottom end of the second tube segment. Here it will act as a stopper and prevent the second tube from sliding downwards into the first tube segment. The rubber padding safely protects the mast against any damage from the clamps.

The second clamp is mounted at the bottom of the third tube segment, etc ... (see table on page 1).

There is no need to tighten the clamps strongly. The rubber ensures a strong grip to the mast, preventing them from sliding down. They will act very well as a stopper and only moderate force is needed when tightening them.

N.B.: There have been misunderstandings about how to install the clamps. Some people mount them on the top of each segment, trying to squeeze the tube to prevent the upper tube segment from sliding downwards. This is not the correct installation method and may result in damaging the mast Please make sure to install the clamps correctly as described above.
